

Emergency operation with E 201 communication error

With VRF ODU that have a “D” in the 9th digit, we now have the capability of shutting one indoor unit down for 12 or 24 hours (based on the option setting) and keep the system running even with an E201 present. Previous models would shutdown due to a communication error. To configure this option you will need to press K2 for 5 seconds, then press K1 repeatedly until you get to segment 22. Once in the segment you will press K4 to set the option for 12 or 24 hours per the chart below.

Optional item	Input unit	SEG1	SEG2	SEG3	SEG4	Function of the option	Remarks
Emergency operation for indoor unit communication error	Main	2	2	0	0	Disabled (Factory default)	
				0	1	operating for up to 12hours	
				0	2	operating for up to 24hours	

Emergency operation function is disabled (setting : 0) E201(communication error) occurs and operation is prohibited.

- If one of the indoor units is shut off or a communication error occurs, all indoor units can not be used.

Emergency operation function is enabled (setting : 1 or 2) E201 is skipped and operation is possible.

- If one of the indoor units is shut off or a communication error occurs, the error is skipped and normal indoor units can be used.
