

Integration Manual

Trane Communicating Thermostats (LonWorks)

SAFETY WARNING

Only qualified personnel should install and service the equipment. The installation, starting up, and servicing of heating, ventilating, and air-conditioning equipment can be hazardous and requires specific knowledge and training. Improperly installed, adjusted or altered equipment by an unqualified person could result in death or serious injury. When working on the equipment, observe all precautions in the literature and on the tags, stickers, and labels that are attached to the equipment.

Introduction

Warnings, Cautions, and Notices

Safety advisories appear throughout this manual as required. Your personal safety and the proper operation of this machine depend upon the strict observance of these precautions.

The three types of advisories are defined as follows:

⚠ WARNING	Indicates a potentially hazardous situation which, if not avoided, could result in death or serious injury.
⚠ CAUTION	Indicates a potentially hazardous situation which, if not avoided, could result in minor or moderate injury. It could also be used to alert against unsafe practices.
NOTICE	Indicates a situation that could result in equipment or property-damage only accidents.

Overview

This manual provides reference and planning information to aid you as you integrate the Trane Communicating Thermostats into a LON network managed by Tracer SC.

Product Description

The Trane Communicating Thermostats are available for heat pump, rooftop, and fan coil applications.

- X13511541020 / -2020

These Trane Communicating Thermostats are LON devices specifically designed for single stage and multi-stage control of heating/cooling equipment such as rooftop and self-contained units. The products feature an intuitive, menu-driven, back-lit LCD display, which walks users through the programming steps, making the process extremely simple.

All models contain two digital inputs, which can be set by the user to monitor filter status, activate a remote temporary occupancy switch, and/or used as a general purpose service indicator. In addition, depending on the model, up to three remote sensor inputs are available. All models contain a SPST auxiliary switch, which can be used to control lighting or disable the economizer function and a discharge air sensor input. For more advanced applications, an economizer control logic has been integrated onto the thermostat for use with proportional damper economizer actuators.

- X13511543020

This Trane Communicating thermostat is specifically designed for fan coil control. The product features a backlit LCD display with dedicated function menu buttons for simple operation.

Three additional inputs are also provided for monitoring and / or various advanced functions.

All models feature configurable System and Fan button functions to meet all possible applications. They all contain an SPST auxiliary switch that can be used to control lighting or auxiliary reheat.

Accurate temperature control is achieved due to the product's PI proportional control algorithm, which virtually eliminates temperature offset associated with traditional, differential-based thermostats.

The Communicating Thermostats contain an SPST auxiliary switch that can be used to control lighting or auxiliary reheat. Three additional inputs are also provided for monitoring and / or various advanced functions.

The thermostats are also compatible with the occupancy sensor cover accessories. Thermostats equipped with an occupancy sensor cover provide advanced active occupancy logic, which will automatically switch occupancy levels from Occupied to Unoccupied as required by local activity being present or not. This advanced occupancy functionality provides advantageous energy savings during occupied hours without sacrificing occupant comfort.

Planning Your Integration

Study the following information presented in the chapters of this guide as you plan the work:

- Communicating Thermostat LonWorks Standard Network Variable Types (SNVTs) and Standard Configuration Parameter Types (SCPTs) and their properties (ranges, values, and enumeration sets). (See [“Summary of SNVTs and SCPTs,”](#) p. 8, [“Input Network Variables \(nvi\) Description,”](#) p. 14, and [“Output Network Variables \(nvo\) Description,”](#) p. 19.)
- Available Graphical User Interface (GUI) objects that you can use in graphics presented in [“Objects You Can Use in Site Graphics,”](#) p. 31.
- Wiring instructions in [“Wiring Requirements for Communicating Thermostats,”](#) p. 33

“How To” Information

The following procedural questions are described or clarified here or in various places in this manual:

Question	Information Location or Answer
How do I identify the Trane Communicating Thermostat on the LonTalk link?	See “Device Identification,” p. 36.
How do I change the location label of the Trane Communicating Thermostat?	See “Location Label,” p. 36.
How do I install a Trane Communicating Thermostat on the Tracer SC LonTalk link?	See <i>Tracer™ SC System Controller Installation and Setup</i> (BAS-SVX31x-EN) (where x is the most recent version)

Input Network Variables (nvi) Description

The following table lists the input network variables for Trane Communicating Thermostats controlling rooftop units, heat pumps, and fan coils.

nvis Applicable to Rooftop Units and Heat Pumps

Table 3. nvis for models X13511541020 and X13511542020

Parameter	Variable Name	Function
Room Temperature	network input SNVT_temp_p nviSpaceTemp	<ul style="list-style-type: none"> This input network variable provides a network remote temperature value to the thermostat. If a valid value is present, the internal temperature reading (internal sensor) is no longer used. Valid Range: -40 to 122°F (-40 to 50°C) Default Null (release) Value: 621.81°F (327.67°C or 0x7FFF) This network variable is subject to the Receive HeartBeat Time, nviRcvHrtBt.
Outdoor Air Temperature	network input SNVT_temp_p nviOutdoorTemp	<ul style="list-style-type: none"> This input network variable provides outdoor air temperature information to the thermostat from a network value temperature value. If a valid value is present, the internal temperature reading (internal sensor) is no longer used. The device will automatically display the value on its display when used. Valid Range: -40 to 122°F (-40 to 50°C) Default Null (release) Value: 621.81°F (327.67°C or 0x7FFF)
Occupancy	network input SNVT_occupancy nviOccManCmd	<ul style="list-style-type: none"> This input network variable is used to command the Space Comfort Controller into different occupancy modes. It is typically set by a supervisory node to manually control occupancy modes, or to override the scheduled occupancy. Default Null Value: OC_NUL = 0xFF Valid Range: <ul style="list-style-type: none"> 0 = OC_OCCUPIED* 1 = OC_UNOCCUPIED* 2 = OC_BYPASS – Not Used 3 = OC_STANDY – Not Used 0xFF = OC_NUL (Release to internal occupancy)** * OC_OCCUPIED and OC_UNOCCUPIED commands always have full authority over the local occupancy routines of the thermostat whether they are a local input or from an occupancy sensor cover. ** OC_NUL command releases the thermostat to use its own internal occupancy routine driven by the local schedule, one of the digital input or that of a occupancy sensor cover installed on board.
System Mode	network input SNVT_hvac_mode nviApplicMode	<ul style="list-style-type: none"> This network variable input is used to coordinate the Space Comfort Controller with any node that may need to control the heat/cool changeover of the unit. Default Null Value: HVAC_AUTO. This network variable is subject to the receive heartbeat time, nciRcvHrtBt Valid Range: <ul style="list-style-type: none"> 0 = HVAC_AUTO 1 = HVAC_HEAT 2 = HVAC_MRNG_WRMUP – Not Used 3 = HVAC_COOL 4 = HVAC_NIGHT_PURGE – Not Used 5 = HVAC_PRE_COOL – Not Used 6 = HVAC_OFF 7 = HVAC_TEST – Not Used 8 = HVAC_EMERG_HEAT – Not Used 9 = HVAC_FAN_ONLY – Not Used 12 = HVAC_MAX_HEAT – Not Used 13 = HVAC_ECONOMY – Not Used 14 = HVAC_DEHUMID – Not Used 15 = HVAC_CALIBRATE – Not Used 0xFF = HVAC_NUL – Not Used
Occupied Cool & Heat Setpoints	network Input SNVT_temp_p nviSetpoint	<ul style="list-style-type: none"> This input network variable is used to allow the occupied temperature setpoints only to be changed via the network from a single analog value. Note: The Unoccupied setpoints are not changed). The corresponding heating and cooling values are derived from the minimum deadband configuration value Default Null Value: 621.81°F (327.67°C or 0x7FFF) Example: If the minimum deadband configuration value = 2 °F and nviSetpoint = 70°F. The resulting Occupied heating setpoint will equal 69 °F which is derived from 70 °F minus ½ the minimum deadband configuration value of 2 °F. The resulting Occupied cooling setpoint will equal 71 °F which is derived from 70 °F plus ½ the minimum deadband configuration value of 2 °F.

Setpoint	network output SNVT-temp_p nvoEffectSetpt	<ul style="list-style-type: none"> This output network variable is used to monitor the effective temperature setpoint which may depend on nciSetpoints, nvoEffectOccup, nviSetpoint and any local setpoint adjustment. For example, if the occupancy state is unoccupied and the heat/cool state is heat, the effective setpoint would be equal to the unoccupied heating setpoint defined in nciSetpoints. Valid Range: -40 to 100°F (-40 to 37.5°C)
Local setpoint output	network output SNVT-temp_p nvoSetPoint	<ul style="list-style-type: none"> This output network variable is used to monitor the space temperature setpoint Valid Range : 40°F to 100°F (4.5°C to 37.5°C) The present value is derived by the following $\text{OccHeat Setpoint} + ((\text{OccCool Setpoint} - \text{OccHeat Setpoint}) / 2)$

Output Network Variables (nvo) Description

nvos Applicable to Fan Coils

All output network variables will be updated no faster than the Minimum Send Time (nciMinOutTm) configuration value. An output network variable will be transmitted immediately when its value has changed significantly (manufacturer's defined). Additionally, this variable will also be transmitted as a heartbeat output on a regular basis as dictated by the Maximum Send Time (nciSndHrtBt) configuration value.

Table 6. nvos for model X13511543020

Parameter	Variable Name	Function		
Room Temperature	network output SNVT_temp_p nvoSpaceTemp	<ul style="list-style-type: none"> This output network variable is used to monitor the effective space temperature sensor that the Space Comfort Controller is using for control. This output echoes the value of the input. Valid Range: 14 to 122°F (-10 to 50°C) The value 621.07°F (327.67°C or 0x7FFF) will be sent as an invalid value in case of a sensor failure. 		
Supply Temperature	network output SNVT_temp_p nvoDischAirTemp	<ul style="list-style-type: none"> This output network variable is used to monitor the temperature of the air that leaves the Space Comfort Controller Note: UI3 needs to be configured to (SS) Supply air sensor monitoring Valid Range: -40 to 122°F (-40 to 50°C) The value 621.81°F (327.67°C or 0x7FFF) will be sent as an invalid value in case of a sensor failure. 		
Room Humidity	network output SNVT_lev_percent nvoSpaceRH	<ul style="list-style-type: none"> This output network variable indicates the space humidity in percent. Valid Range: 0 to 100%. The value 0x7FFF = +163.835% will be set as an invalid value to indicate a humidity sensor failure. 		
Effective Occupancy	network output SNVT_occupancy nvoEffectOccup	<ul style="list-style-type: none"> This output network variable is used to indicate the actual occupancy mode of the unit. This information is typically reported to a supervisory controller or provided to another Space Comfort Controller to coordinate the operation of multiple units Valid Range: <ul style="list-style-type: none"> 0 = OC_OCCUPIED 1 = OC_UNOCCUPIED 2 = OC_BYPASS1 3 = OC_STANDBY Note: OC_BYPASS can be initiated by either nviOccManCmd or a local input. NvoEffectOccup will only be in OC_BYPASS for the duration of the ToccTime (nciGenOpts), until reinitiated by either a transition of the local input or an update to nviOccManCmd. 		
Unit Status network output	SNVT_hvac_status nvoUnitStatus	<ul style="list-style-type: none"> This output network variable is available to report the Space Comfort Controller status. It combines the operating mode, the capacity of heating and cooling used and an indication if any alarms are present in the object.

Wiring Requirements for Communicating Thermostats

The term “Device” is used to represent any controller with an active Echelon network connection, including Trane controllers.

Product Specifications

Specifications for Communicating Thermostats are as follows.

Table 10. Summary of specifications for a LON network

Specification	Details
Network Wiring	22 AWG Echelon Level 4, unshielded, twisted pair
Polarity	Polarity insensitive
Termination for Doubly Terminated Bus Network Segment	Two RC network with $R_a = 105\Omega \pm 1\%$, 1/8W
Number of transceivers per segment	Up to 60
Number of communication stubs per LonTalk link	8 (16 if a repeater is used)
Maximum wire length per communication stub	50 feet (15 m)
Baud rate	78000 bits per second

Network Configuration

The Echelon network is designed to support free topology wiring and accommodates bus, star, loop or mixed topologies. Echelon devices can be located at any point along the network wiring. The following figures present five different network topologies. The actual termination circuit will vary by application.

Figure 5. Singly terminated bus topology

Legend: T Termination

Wiring Requirements for Communicating Thermostats

Figure 6. Doubly terminated bus topology

Maximum Number Of Devices

Up to 64 transceivers are allowed per network segment. If your network requires more than 64 transceivers a repeater is then required to extend your network

Maximum Cable Length

The maximum length of a chain is related to its transmission speed. The longer the chain, the slower the speed. Using proper cable, Echelon supports a baud rate of 78 kilobits per second for distances up to 4500 ft (1371.60 m) in bus topology with double terminations.

If you require a maximum network length of more than 4500 ft (1371.60 m), then a repeater is required to extend the network.

Repeater

In the event that the limits on the number of transceivers or total wire distance are exceeded, a physical layer repeater can be added to interconnect two or more network segments. A repeater doubles the overall channel capability, including node count and network extent, but not bandwidth. Note that only one physical layer repeater should be placed in series between any two nodes on a channel. If additional cabling or network bandwidth is required, then a LonWorks Router should be used in place of a repeater.

Resistance Termination for LonTalk Links

To correctly install a LonTalk link, termination resistors are required at the first and last devices on each link. Electrical resistors drop the voltage of the current flowing through the wire so that electrical noise is absorbed.

For correct termination placement, follow these guidelines:

- Terminate a daisy-chain configuration with a 105 ohm resistor at each end of the link.
- If a repeater is used, each link of the configuration that is created by the repeater requires termination resistors.
- Trane recommends that only 22-gauge, Level 4 wire be used for the LonTalk communication link.
- During installation, compile a set of as-built drawings or a map of the communication wire layout. Sketches of the communication layout should feature the termination resistor placement.

Polarity

Although network connections are polarity insensitive, it is good practice to keep polarity consistent throughout the entire site.

Communicating Thermostat Status LEDs

Table 11 explains the different behaviors of the Status LED on a LON thermostat.

Table 11. Fan coil thermostat LED behaviors

Behavior	Explanation
Continuously ON	The device has no application loaded in its memory and is Un-configured
Blinking	The device has an application loaded in its memory but is unconfigured. When a device is in the unconfigured state, it does not know which devices to communicate with. A network management tool is used to logically bind the node to another in a LonWorks network.
Continuously OFF	The device has an application loaded into its memory and is bound onto a LonWorks network.

Troubleshooting

Table 12 lists possible causes and solutions when the thermostat does not come online.

Table 12. Troubleshooting Causes and Solutions

Error / Trouble	Possible Cause	Solution
Thermostat does not come online	The LON network has too many devices.	Do not exceed the maximum number of devices and maximum length allowed by the EIA-485 specifications.
	Too many devices were installed without any repeaters.	Repeaters need to be installed as specified in this document.
	The LON cable runs are broken	Locate the break and correct wiring
	The thermostat does not have power	Apply power to the thermostat

LON Network Configuration

This section covers need-to-know topics related to LON network configuration.

Device Identification

An Echelon device has a unique mechanism to identify itself, the Neuron ID, which is obtained during commissioning.

You can use the equivalent of a Service PIN to identify the device at commissioning. However, the LonTalk card does not have a Service PIN on top of the board. Instead perform the following actions:

- For fan coil thermostats
Press simultaneously the **Up** button and the **Down** button located on the keypad interface of a thermostat.
- For rooftop unit and heat pump thermostats
Press simultaneously the **Yes** and **No** buttons located on the keypad interface.

In either case, the Program ID and the Neuron ID (LonWords Unique ID) contained in the device are transmitted to the commissioning or service tool.

A single green status LED located on the bottom of the LonTalk board is normally off. It will blink once when the device accepts the Service PIN command. There is no Service LED.

Location Label

The location label cannot be set in Rover. NLUtil can change the location label, but you need to use ASCII characters to set each letter. To set the location label, download NLUtil from www.newron-system.com and an ASCII table from www.ascitable.com.

Because Rover does not have a plug-in, we cannot perform adequate pre-commissioning start-up without NLUtil, and we cannot verify setup with Rover.

Additional Information and Considerations

Items that apply to all thermostats

- In order to operate nviAuxOut (auxiliary output) from the network, Aux contact configuration (Auxcont nciGenOpt) needs to be set as "Network Controlled."
- If the heartbeat is lost, the module will release the network sensor value for the Room Temperature (nviSpaceTemp) and the Outdoor Temperature (nviOutdoorTemp).

Items that apply to fan coils

The SeqOpera value (Sequence of Operation) depends on the nviHeatCool value and nviAuxHeatEnable value. (See [Table 9, p. 30](#) for all the details.)

Items that apply to rooftop units and heat pumps

For nciMultOpt, Trane recommends use of either one of the following format files:

- UNVT_rt_opts#US or UNVT_rt_opts#SI for Roof Top models
- UNVT_hp_opts#US or UNVT_hp_opts#SI for Heat Pump models

Trane - by Trane Technologies (NYSE: TT), a global climate innovator - creates comfortable, energy efficient indoor environments for commercial and residential applications. For more information, please visit trane.com or tranetechnologies.com.

Trane has a policy of continuous product and product data improvement and reserves the right to change design and specifications without notice. We are committed to using environmentally conscious print practices.
